```
The present invention relates to novel G protein-coupled receptors (nGPCBX; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27, 28, 31-38, 40, 41, 53-60) and their coding sequences. The present sequence is one such G protein-coupled receptor. GPCRs are also known as seven transmembrane receptors and function in signal transduction. The nGPCRx coding sequences are useful for screening a human to diagnose a disorder affecting the brain or a genetic predisposition, specifically schizophrenia. nGPCRx are useful for identifying compounds useful for treating schizophrenia. Detection of nGPCRx in a sample is useful as a diagnostic tool for diseases or disorders e.g. thyroid disorders, renal failure, rheumatoid arthritis. CNS disorders, infections such as HIV-1,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       and neuronal disorders such as Alzheimer's disease, Parkinson's disease, migraine and senile dementia. Additional disorders include inflammatory conditions (e.g. Crohn's disease), rheumatoid arthritis, autoimmune disorders, cancers, respiratory ailments such as asthma, and inflammatory diseases e.g. inflammatory bowel disease
                                                                                                                          New G protein-coupled receptor (nGPCR-x) and its encoding polynucleotide useful for diagnosing and treating e.g. schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               hormonal disorders. Modulators of nGPCRx activity have the utility for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       treating neurological disorders, including schizophrenia, ADHD/ADD (attention deficit-hyperactivity disorder/attention deficit disorder),

The invention relates to nucleic acid sequences (ABA81529-ABA81552) that encode G-coupled protein-receptor related polypeptides (ABB44522-CC BBB44543). The isolated polypeptide having a sequence differing by no more than 15 % of amino acid residues from one of 22 amino acid sequences (or mature forms of the sequences), fully defined in the specification and corresponding to human G-protein coupled receptor X (GPCKX) completes. The polypeptides have potential cardiant, antiarteriosclerotic, anabolic, cytostatic and antiviral activity. The polypeptides can be administered therapeutically, especially using gene therapy and expressing the encoding DNA in vivo, to treat or prevent GPCKX-associated disorders, especially in humans. For example, they can be used to treat/prevent cardiomyopathy, atherosclerosis, disorders cobesity, anorexia), diabetes, osteoporosis, Crohn's disease, multiple cobesity, anorexia), diabetes, osteoporosis, Crohn's disease, multiple cobesity, asthma, cancers, meurodegenerative disorders (e.g. Alzheimer's disease, Parkinson's disease, neurological disorders, hadmatopoietic disorders, huntington's disease, immune disorders, bacterial, fungal, protozoal and viral infections (e.g. with human immunodeficiency virus (HIV)-1 or HIV-2). They can be used diagnostically detecting altered levels of the polypeptide in mammals (especially humans) by detecting altered levels of the polypeptide in mammals (especially humans) by control samples. They are useful to identify apents binding polypeptide control samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (e.g. cellular receptors or downstream effectors) and/or agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1; Page 8; 157pp; English.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel isolated G-Protein Coupled Receptor (GPCR) protein. The methods and compositions of the present invention are useful for diagnosis, treatment, amelioration and/or prevention of diseases associated with G-Protein Coupled Receptor (GPCR) polypeptides, such as obesity, diabetes, dyallpidaemia, asthma, bronchitis, allergies, angina, glomerulonephritis, hepatitis and allograft rejection. This polymucleotide sequence represents the DNA encoding the human GPCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New GPCR polypeptide and encoding nucleic acid molecule, useful for diagnosis, treatment and/or prevention of diseases associated with GPCR polypeptides, such as obesity, diabetes, asthma, allergies, angina and

New G protein-coupled receptor (nGPCR-x) and its encoding polynucleotide useful for diagnosing and treating e.g. schizophrenia.

Claim 4; Page 89; 261pp; English.

The present invention relates to novel G protein-coupled receptors (nGPCRx, where x is 1, 3, 4, 5, 9, 11, 12, 14+18, 20, 21, 22, 24, 27, 28, 11-38, 40, 41, 53-60) and their coding sequences. The present sequence is the coding sequence for one such G protein-coupled receptor. GPCRs are also known as seven transmembrane receptors and function in signal transduction. The nGPCRx coding sequences are useful for screening a human to diagnose a disorder affecting the brain or a genetic predisposition, specifically schizophrenia. nGPCRx are useful for identifying compounds useful for treating schizophrenia. Detection of disorders as a diagnostic tool for diseases or disorders in the sequences and failure, rheumatoid arthritis, CNS disorders, infections such as HIV-1, metabolic and cardiovascular diseases, proliferative disorders and hormonal disorders. Modulators of nGPCRx activity have the utility for treating neurological disorders,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to the isolation of a novel human G-protein coupled receptor (GPCR) which is related to the chemokine receptor subfamily. The CDNA and gene sequences encoding for GPCR are also given in the invention. The sequences of the invention are useful for diagnosing and treating diseases or conditions mediated by human proteases. Such diseases include hyperproliferative disorders (e.g. proteases), herrological disorders (e.g. Parkinson's disease), psychiatric diseases (e.g. schizophrenia), inflammatory disorders (e.g. diabetes) and respiratory disorders (e.g. adult respiratory distress syndrome, ARDS). The GPCR protein is also useful for identifying a modulator of the expression of the protein. It also serves as a target for identifying agents for use in mammalian therapeutic applications, contentifying aparticularly modulating a biological or pathological response in a cell or tissue that expresses the protein, in biological

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               540
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              540
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           009
                      receptor subfamily, in drug screening assays and in competition binding assays. GPCR is also useful in diagnosting a disease or predisposition to a disease mediated by the peptide, in pharmacogenomic analysis. The polynucleotide sequences can also be used in gene therapy. The present sequence encodes for the novel human GPCR of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     420

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                             The endogenous and non-endogenous, constitutively activated versions of human G-protein coupled receptors (GPCR), are useful for direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists having applicability as therapeutic agents for treating diseases related to GPCR, e.g. lung cancer. Non-endogenous version of human GPCRs are also utilized in research settings and in vitro and in vivo system, incorporating GPCRs can be utilised to

XE	New nucleic acids and polypeptides of the nG protein-coupled receptor,
Z & &	userul for treating or diagnosing a mental disorder or a disorder affecting the brain, e.g. anxiety disorders, schizophrenia, stroke or parkinen's disease
XX	Example 1; Page 84; 244pp; English.
XX	
	The invention discloses an isolated human polypeptide, and encoding nucleic acid, for a G protein-coupled receptor (GPCR), particularly the
388	no process complete receptor-1* (mer.k-1*). Greak are vical in the communication between cells and their enviconment and are characterised by a carrentine etructure that naces the characterised
}	by a beirentine belucture that passes through the cell membrane seven

us-10-076-260-1.rng

times, hence the reason such receptors are sometimes called seven transmembrane receptors (7TM). The polynucleotides and polypeptides are useful for identifying an negber allelic variant that correlates with a mental disorder, for isolating an antibody that binds to an epitope of the polypeptide, for identifying a compound that binds the polypeptide or polynucleotide and/or modulates its biological activity, for screening a human subject to diagnose a disorder, or a genetic predisposition to a disorder, affecting the brain or a genetic disposition to the disorder, or identifying a compound useful for the treatment of a mental disorder, and for identifying a compound useful as a modulator of binding between nGPCR-14 and a binding partner of nGPCR-14. The polypeptide is also useful for inducing an immune response in a mammal. The nucleic acid or polypeptide is particularly useful, using gene therapy, for treating e-granxiety disorders, depression, bipolar disorder, schizophrenia, thutington's disease dyskinesias, manic depression, stroke, Parkinson's disease or alzheimer's disease. The nucleic acid and polypeptide may also be used for treating diabetes, inflammation or wounds. The sequences presented in ABST02248, ABST02248, ABST02243 are the DNAs encoding the nGPCRs (also referred to as beGPCRs)

1020 receptor (GPCR) genes (ABZ42870-ABZ42156) and/or GPCR proteins (ABP95596-ABP95942) by extracting open-reading frames containing 6-8 transmembrane domains with 250-1000 amino acid residues to give a gene homologous with a known GPCR gene. The receptor proteins and encoded genes are useful for studying in vivo signal transduction mechanism and identifying targets for drug development e.g. based on olfactory and qustatory receptors in form of agonists and antagonists by screening intrinsic and extrinsic ligands as bitter taste inhibitors, taste enhancers and fragrance improvers. Note: The sequence data for this patent did not form part of Human, GPCR, G protein coupled receptor; signal transduction; olfactory; drug development; gustatory; taste; fragrance; gene; ds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
```

The invention comprises the amino acid and coding sequence of the human purinergic-like G-protein coupled receptor AXORB7. The AXORB7 DNA and protein sequences of the invention may be used for treating diseases related to immunity, autoimmunity, inflammation, immuncadeficiency, and infections (i.e. bacterial, fungal, viral, protozoan). The AXORB7 DNA and protein sequences are particularly useful for treating: cancers, diabetes, obesity, anorexia, bullmia, asthma, psoriasis, rheumatcid arthitis, osteoarthritis, as well as psychotic and neurological disorders. The AXORB7 DNA and protein sequences may also be used as the human AXORB7 protein New purinergic-like G-protein coupled receptor AXOR87 polypeptide and polynucleotide, useful for treating diseases related to autoimmunity, inflammation, immunodeficiency, or bacterial, fungal, viral and protozoal G; 261 T; 0 U; 0 Other;

The present sequence encodes a human G protein-coupled receptor (GPCR), designated GAVE3. GAVE3 is located on human chromosome 12. GAVE3 has antinflammatory, antiasthmatic, antirheumatic and antiarthritic activities. GAVE3 nucleic acids, polypeptides, agonists and antagonists can be used for preventing or treating a disorder associated with aberrant GAVE3 expression or activity, e.g. inflammatory disorders such as asthma, chronic obstructive pulmonary disease or rheumatoid arthritis. The nucleic acids and polypeptides can also be useful for identifying modulators, i.e. candidate or test compounds, that bind to GAVE3 proteins or attivity. The nucleotide sequences can also be used for chromosomal activity. The nucleotide sequences can also be used for chromosomal can be used for producing non-human transgenic animals for studying the function and/or activity of GAVE3 or for identifying and/or evaluating modulators of GAVE3 activity
                                                                                                                                                                                                                                Human, GAVE3; G protein-coupled receptor; GPCR; antiinflammatory;

coupled receptor (GCCR) characterised as a respiratory chemokine receptor. The receptor is expressed in respiratory chemokine receptor. The receptor is expressed in respiratory tissues and tissues airway fibrosis, regulation of epithelial differentiation, regulation of mucocilliary clearance, regulation of inflammation, modulation of neutrophil, T-cell and eosinophil migration and/or activation, and regulation of epithelial cell or mast cell activation, on the properties and polymucleotides of the invention may be useful in treatment of asthma, chronic obstructive pulmonary disease, emphysema, chronic hondhitis, acute respiratory distress syndrome, cough acute bronchitis. Methods of identifying agonist and antagonist compounds that stimulate or inhibit the function or level of the novel receptor are also provided. GPCR polymetectides can also be used for recombinant production of GPCR polymetectides, as diagnostic reagents, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polypeptide, useful for diagnosing or treating e.g., astima, chronic obstructive pulmonary disease, emphysema, chronic bronchitis or acute respiratory distress syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is the coding sequence for a novel human G-protein

The present invention relates to novel G-protein coupled receptors (GPCRs) and the nucleic acids encoding them. The invention is useful for treating viral, bacterial and fungal infections, inflammatory and

neoplastic processes, pain, diaberes, hypertension, osteoporosis, cancer angina pectoris, myocardial infarction and atherosclerosis. The present sequence is human G-protein coupled receptor (GPCR) DNA

Novel G-protein coupled receptor useful for treating viral infections, bacterial infections, fungal infections, cancer, diabetes, hypertension, osteoporosis, angina pectoris, myocardial infarction, atherosclerosis.

mutiarteriosclerotic, anabolic, cytostatic and antivital activity. The mutiarteriosclerotic, anabolic, cytostatic and antivital activity. The polypeptides can be administered therapeutically, especially using gene therapy and expressing the encoding DNA in vivo, to treat or prevent efforts. Associated disorders, especially in humans. For example, they can be used to treat/prevent cardiomyopathy, atherosclerosis, disorders related to signal processing and metabolic pathway modulation (e.g. obesity, anorexia), diabetes, osteoporosis, Croin's disease, multiple sclerosis, asthma, cancers, neurodegenerative disorders (e.g. Alzheimer's disease, parkinson's disorder. Huntington's disease, immune disorders, developmental diseases, immune disorders, bacterial, fungal, protozoal and viral infections (e.g. with human immunodeficiency virus (HIV) or HIV-2). They can be used diagnostically with altered levels of the polypeptide in mammals (especially humans) by account of the presence of the procession of the processi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to nucleic acid sequences (ABAB1529-ABAB152) that encode G-coupled protein-receptor related polypeptides (ABB44522-ABB4543). The isolated polypeptide having a sequence differing by no more than 15 % of amino acid residues from one of 22 amino acid sequences (or mature forms of the sequences), fully defined in the specification and corresponding to human G-protein coupled receptor X (GPCRX) polypeptides. The polypeptides have potential cardiant,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New human G-protein coupled receptor X, GPCRX, polypeptide useful in treatment or prevention of GPCRX associated disorders e.g. cardiomyopathy or atherosclerosis, and to screen for antagonists and agonists useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Spaderna SK;

The invention relates to nucleic acid sequences (ABA81529-ABA81522) that encode G-coupled protein-receptor related polypeptides (ABB44522-CC ABB44543). The isolated polypeptide having a sequence differing by no more than 15 % of amino acid residues from one of 22 amino acid sequences (or mature forms of the sequences). fully defined in the specification and corresponding to human G-protein coupled receptor X (GPCRX) couply expetides. The polypeptides have potential cardiant, cyrostatic and antiviral activity. The polypeptides can be administered therapeutically, especially using gene therapy and expressing the encoding DNA in vivo, to treat or prevent GPCRX-associated disorders, especially in humans. For example, they can be used to treat/prevent cardiomyopathy, atherosclerosis, disorders cobesity, anorexia), diabetes, osteoporosis, Crohm's disease, multiple selerosis, asthma, cancers, neurodegenerative disorders (e.g. Alzheimer's disease, Parkinson's disorder, Huntington's disease, immune disorders, hadematopoietic disorders, developmental diseases, neurological disorders, bacterial, fungal, protozoal and viral infections (e.g. with human immunodeficiency virus (HIV)-1 or HIV-2). They can be used diagnostically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        w human G-protein coupled receptor X, GPCRX, polypeptide useful in eatment or prevention of GPCRX associated disorders e.g. cardiomyopathy atherosclerosis, and to screen for antagonists and agonists useful
                                                   Human; GCPR; G-coupled protein-receptor; cardiant; antiarteriosclerotic; anabolic; cytostatic; antiviral; gene therapy; cardiomyopathy; obesity; anorexia; diabetes; osteoporosis; Crohn's disease; multiple sclerosis; asthma; Alzheimer's disease; Parkinson's disease; Huntington's disease; infection; human immunodeficiency virus; HIV; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Spaderna i

                   (especially humans) by
to determine the presence of or predisposition to a disease associated with altered levels of the polypeptide in mammals (especially humans) by detecting alterations in polypeptide expression levels relative to control samples. They are useful to identify agents binding polypeptide (e.g. cellular receptors or downstream effectors) and/or agents modulating cellular polypeptide expression or activity, useful as

ö New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis or diabetes, and in chromosome mapping, tissue typing pharmacogenomics

20; SEQ ID NO 177; 560pp; English

The invention relates to a novel NOVX polypeptide. The polypeptide of the invention demonstrates cardiant, antiarteriosclerotic, hypotensive, oytostatic, anorectic, antidabetic, immunosuppressive, anti-HIV, neuroprotective, nootropic, antidabetic, immunosuppressive, anti-HIV, synaecological activities and may be useful in diagnosing, treating or preventing NOVX-associated disorders including cardiomyopathy, atherosclerosis, hypertension, cancer, obesity, diabetes, AIDS, multiple solerosis, graft-versus-host disease, Alzheimer's disease, Rukinson's disease, asthma or fertility disorders. Furthermore, the polypeptides may be utilised as vaccines whilst the nucleic acids may be used as hybridisation probes, in gene therapy, chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The current sequence is that of the human NOV CDNA of the invention.
